

Failing bearings thing of the past for German paper mill

With bearing failures approximately every 3 months, German paper mill called in AESSEAL® for help.

After consultation with AESSEAL®, the paper mill had a 280mm LabTecta® TE installed on a continuous digester following the discovery of water contamination in the bearings.

Since it's installation in 2006, it has been running 24 hours a day, 7 days a week.

The LabTecta® TE is a top entry bearing protector, allowing for installation on a vertically positioned shaft.

“No water contamination”

Industry:	Pulp & Paper
Product:	LabTecta
Application:	Continuous digester
Country:	Germany
Reference no:	3232
