

Enhanced production reliability

Failing double component seals were causing problems for a specialist food producer in eastern France. The result was product leakage and costly production shutdowns.

The company turned to AESSEAL® in search of a possible solution. AESSEAL® recommended the installation of its double balanced seals with a cartouche design. They were installed in August 2023, and have now been working perfectly for over nine months, with no premature wear on the seal faces, and no leakage of product. This compares to an MTBF of just four months with the previous seals.

The installation of this more robust and reliable seal means that the company has avoided costly interruptions for repair and maintenance and further production shutdowns.

‘Costly interruptions avoided’

Industry:	Food & Beverage
Product:	DMSF™
Application:	Grinding Mill
MTBF Increase:	125% (and counting)
Reference N.O:	TD3104786
