AESSEAL® product brings big savings for South African company

The installation of an AESSEAL® FGDSS-N™ single slurry seal is saving a South African mining company thousands of dollars a year in repair and maintenance costs.

The pumps on the company’s tailing lines had been using a gland packing system, but persistent product leakage meant that they had to be repacked every other day, resulting in unscheduled downtime and repair and maintenance costs of some R350,000 (or around US\$20,000) a year for each pump.

AESSEAL® recommended the installation of its FGDSS-N™ single mechanical seal, which is specially designed for general slurry applications. Its robust construction makes the seal particularly suitable for the highly abrasive environment of slurry pumps.

The seals, installed in May 2024, have been working for more than five months without a problem, and have already produced a return on investment. Product is no longer leaking into the atmosphere, there are no ongoing clean-up costs, and maintenance costs have been dramatically reduced, with total savings estimated to be more than R200,000 (US\$11,500) a year. The company is now going ahead with plans to fit FGDSS-N™ seals to all five pumps on its two tailing lines.

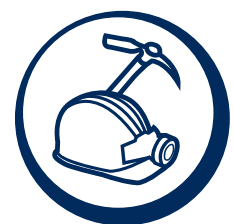

Before installation

After installation

‘Reliability increase from <2 days to >5 months’

Industry:	Mining
Product:	FGDSS-N™
Application:	Chrome Mine Wash Plant
MTBF Increase:	7,550% (and counting)
Savings:	>\$11,500 each year
Reference N.O:	TD3112068
